

Quantification of 1,25-Dihydroxyvitamin D₂ and D₃ From Human Serum Using Immunopurification, ACQUITY UPLC, and Xevo TQ-S micro

Nikunj Tanna, Mark Wrona, and Kelly Doering
 Waters Corporation, Milford, MA

APPLICATION BENEFITS

- Highly sensitive and robust method
- Ability to detect 5 pg/mL using Waters® ACQUITY UPLC® and Xevo® TQ-S micro systems
- Accuracy and precision of <15% across the calibration range of 5–500 pg/mL

INTRODUCTION

Vitamin D is an important fat-soluble vitamin, which helps maintain bone health. Vitamin D exists in two primary forms: Vitamin D₃ (cholecalciferol) synthesized from 7-dehydrocholesterol when the skin is exposed to UV radiation from sunlight, and Vitamin D₂ (ergocalciferol) produced by plants and fungi through solar irradiation of ergosterol. Vitamin D is converted first to 25-hydroxyl (OH) Vitamin D by the liver via the CYP family of enzymes (Figure 1). 25 (OH) Vitamin D is then hydroxylated into its biologically-active form: 1,25-dihydroxy (OH)₂ Vitamin D in the kidneys.

This conversion is tightly controlled through a cascade pathway which involves calcium, phosphorous, parathyroid hormone, and Vitamin D receptors. Regulated by a feedback mechanism process, 1,25 (OH)₂ Vitamin D circulates in the pg/mL-level range in serum. Main application areas for the measurement of Vitamin D are in nutrition, pharmacokinetic studies, clinical studies, and quality control for foods and supplements.¹

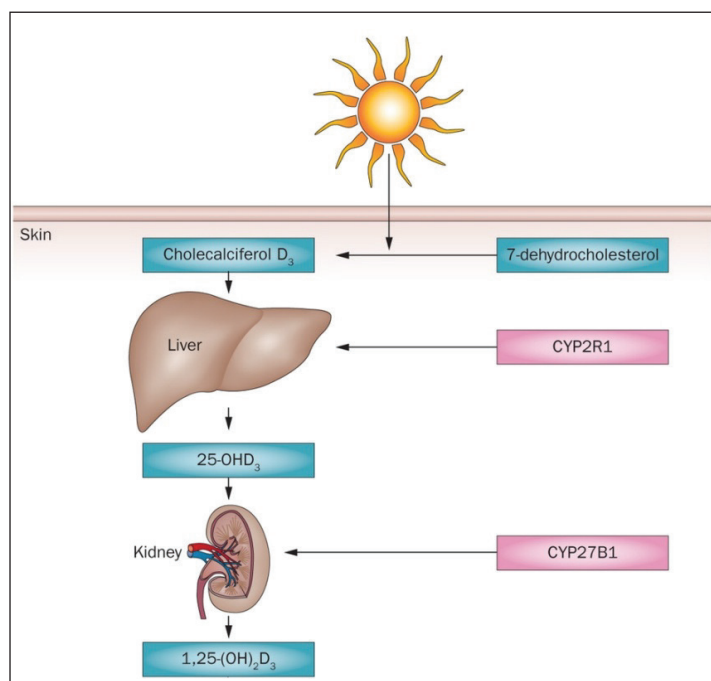

Figure 1. Process for conversion of 7-dehydrocholesterol to 1,25 (OH)₂ Vitamin D₃.²

In recent years, LC-MS/MS assays – compared to immunoassays – have gained popularity as the method of choice for quantification of 1,25(OH)₂ Vitamin D. LC-MS/MS assays provide orthogonal selectivity. The identity of every compound is based upon its retention time as well as its unique MRM transition. The addition of immunoaffinity using specific antibodies in sample cleanup adds an extra layer of selectivity to the assay.

LC-MS/MS is accepted by the FDA as the gold standard analytical technique for pharmacokinetic studies of small molecules. The FDA has set specific guidelines to be followed while developing and validating LC-MS/MS assays. These guidelines involve intra-day (within the same day) and inter-day (across multiple days) accuracy and precision studies, linearity, and reproducibility. The method presented here followed the Bioanalytical Method Validation guidelines set out by the FDA. Accuracy, precision, linear range, and reproducibility of the method was evaluated, and the method met the criteria detailed in the FDA guidelines.³

The data presented in this application note was generated using a Waters ACQUITY UPLC System and Xevo TQ-S micro Mass Spectrometer.

EXPERIMENTAL

Sample description

Commercially-available immunopurification kits were purchased from ALPCO Diagnostics and used to extract 1,25 (OH)₂ Vitamin D from 500 µL of human serum. The eluate from the last step was evaporated to dryness. Samples were derivatized with PTAD (4-phenyl-1,2,4-triazoline-3,5-dione) using 100 µL of 0.75 mg/mL PTAD in acetonitrile, which was added to each tube and allowed to incubate in the dark – at room temperature – for one hour. PTAD was then evaporated using a CryoVac system. The contents of the tubes were reconstituted using 50 µL of 50:50 water–methanol mix. This solution was then transferred to LC-MS/MS vials, and 20 µL were injected into a column.

Method conditions

LC conditions

Instrument:	Waters ACQUITY UPLC
Column:	ACQUITY UPLC BEH C ₁₈ , 1.7 µm, 2.1 mm x 50 mm (P/N 1860002350)
Column temp.:	60 °C
Sample temp.:	4 °C
Injection volume:	20 µL
Flow rate:	0.500 mL
Mobile phase A:	100% water, 0.1% formic acid, 2 mM methylamine
Mobile phase B:	100% methanol, 0.1% formic acid, 2 mM methylamine
Gradient:	Start with 50% A and hold for two minutes. Change to 80% B between 2–4 minutes. Followed by one minute of flushing and one minute of equilibration.

MS conditions

Instrument:	Xevo TQ-S micro
Ionization mode:	ESI+
Transitions:	1,25 (OH) ₂ Vit D ₃ – 574.2>314.1 1,25 (OH) ₂ Vit D ₂ – 635.3>314.1 1,25 (OH) ₂ Vit D ₃ Int std – 580.3>314.1 1,25 (OH) ₂ Vit D ₂ Int std – 641.3>314.1
Capillary voltage:	2.5 kV
Cone voltage:	25 V
Desolvation temp.:	500 °C
Desolvation gas:	1000 L/Hr
Cone gas:	25 L/Hr

RESULTS AND DISCUSSION

1,25 (OH)₂ Vitamin D is an important biomarker tested routinely in clinical and bioanalytical laboratories. The extremely low circulating levels of this molecule, coupled with lack of ionization in electrospray ionization mode, make this a challenging assay. The method described here combines affinity-based sample preparation combined with derivatization to increase ionization as an elegant solution for this analytically-difficult molecule.

Calibration curve and residual plots

Calibration curve from 5–500 pg/mL is linear and % bias across the range is <15% for both 1,25 (OH)₂ Vit D₂ and D₃ as shown in Figure 3a and 3b.

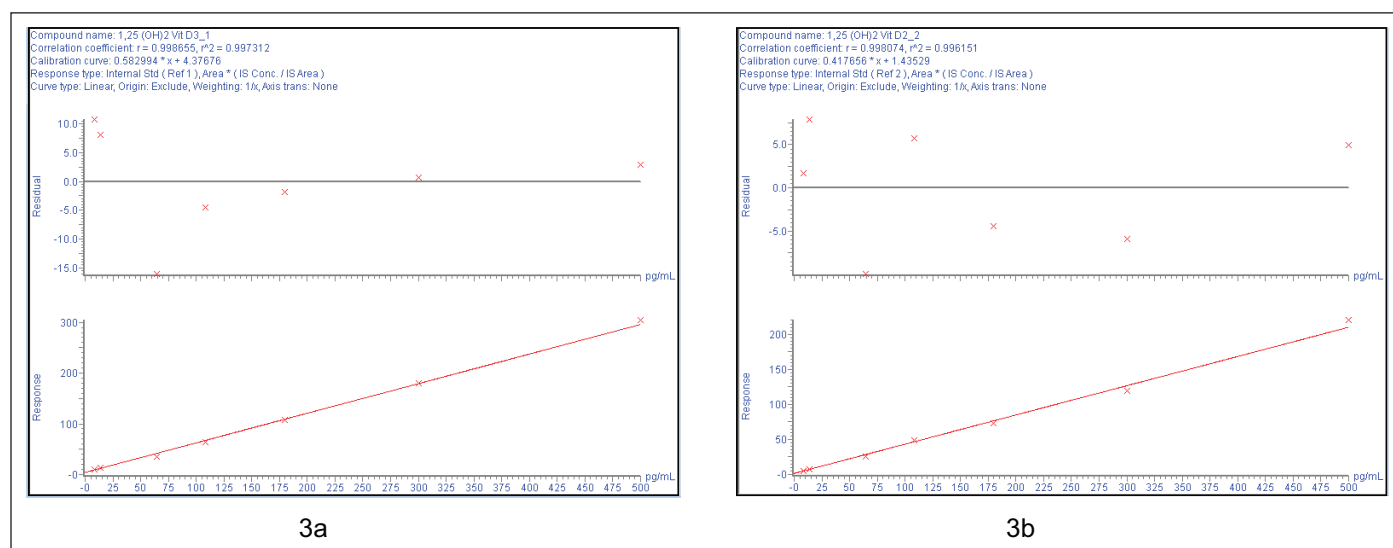

Figure 3a. Residual plot and calibration curve for 1,25 (OH)₂ Vit D₃. Figure 3b. Residual plot and calibration curve for 1,25 (OH)₂ Vit D₂.

Inter-day accuracy and precision

Six replicates at low (30 pg/mL), mid (150 pg/mL), and high (300 pg/mL) QC levels were extracted and injected across three days. The intra-day and inter-day precision and accuracy were <15% at all levels as shown in Tables 1–4.

Injection reproducibility

The Waters ACQUITY UPLC and Xevo TQ-S micro displayed robust injection reproducibility as shown below. The % CV for the retention times was 0.32% (Figure 4a) and the % CV for analyte area counts was 5.21% (Figure 4b) – both of which are well within the acceptable criteria.

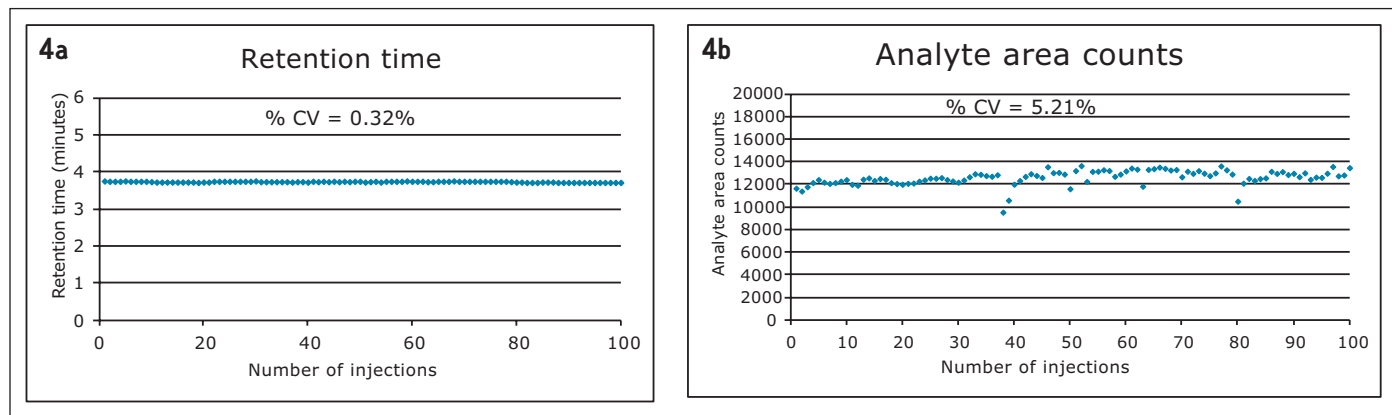

Figure 4a. % CV for retention time over 100 injections. Figure 4b. % CV for analyte area counts over 100 injections.

Instrument dynamic range

The analytical range for this method is from 5–500 pg/mL and covers the relevant concentrations typically found in serum.

1,25 (OH)₂ Vitamin D showed linearity from 50 pg/mL–1 µg/mL using the ACQUITY UPLC and TQ-S micro for the method described here.

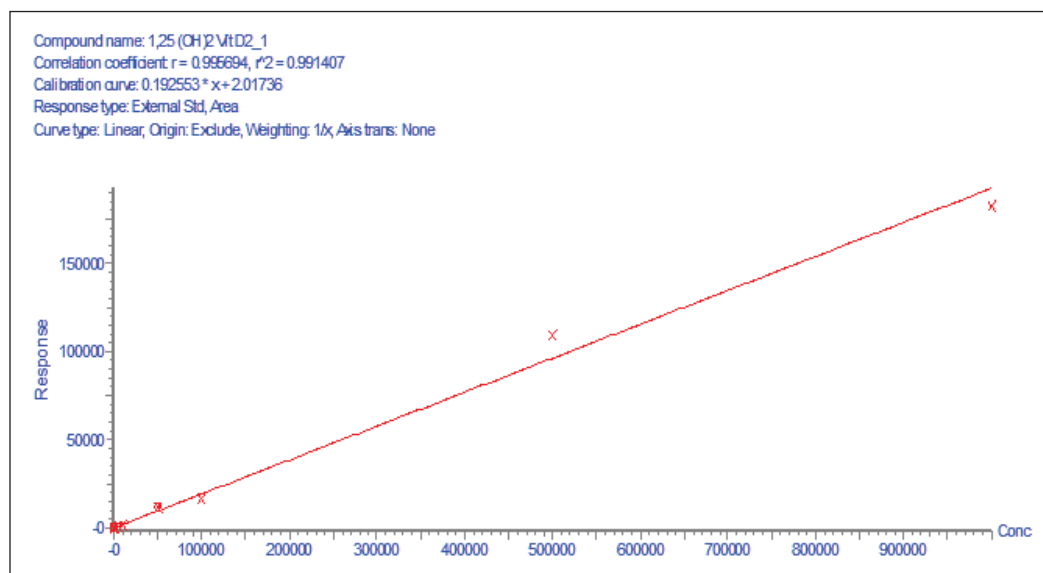

Figure 5. Linear dynamic range >4x.

CONCLUSIONS

A robust, selective, and sensitive analytical method for the quantification of 1,25 (OH)₂ Vitamin D₂ and D₃ from human serum was developed using the Waters ACQUITY UPLC System and Xevo TQ-S micro Mass Spectrometer. A limit of quantification of 5 pg/mL was readily achieved while maintaining excellent linearity. Calibration curves for both 1,25 (OH)₂ D₂ and D₃ were linear over the range of 5–500 pg/mL with $r^2 > 0.99$. Across three days, the intra- and inter-day CV as well as the % bias were <15% for both 1,25 (OH)₂ Vitamin D₂ and D₃. Injection reproducibility was excellent with % CV <0.32% for retention time and <5.5% for area counts.

Today's analytical laboratories are becoming more diverse and multi-functional. Lab managers are expected to diversify their analytical platforms within limited lab spaces. The Xevo TQ-S micro has the ideal combination of sensitivity, reproducibility, and versatility to provide an excellent option for all types of bioanalytical labs.
